ABENHALL LANE, MITCHELDEAN AGRICULTURAL LAND CLASSIFICATION SURVEY

INTRODUCTION

ļ

1. This report presents the findings of a detailed Agricultural Land Classification (ALC) survey of 3.8 ha of land at Gloucester Road and Abenhall Lane, Mitcheldean. Field survey was based on 9 auger borings and was completed in February 1998. During the survey 1 sample was analysed for particle size distribution (PSD).

2. The survey was conducted by the Resource Planning Team of FRCA Western Region on behalf of MAFF in its statutory role in the preparation of Forest of Dean Local Plan.

3. Information on climate, geology and soils, and from previous ALC surveys was considered and is presented in the relevant section. Apart from the published regional ALC map (MAFF, 1977), which shows the sites at a reconnaissance scale as Grades 2 and 3, the sites had not been surveyed previously. However, the current survey uses the Revised Guidelines and Criteria for grading the quality of agricultural land (MAFF, 1988) and therefore supersedes any previous ALC survey. Grade descriptions are summarised in Appendix I.

4. At the time of survey land cover was grass for grazing.

SUMMARY

5. The distribution of ALC grades is shown on the accompanying 1: 10 000 scale ALC map. The detail of information shown at this scale is appropriate to the intensity of field survey but could be misleading if enlarged or applied to small areas. Areas are summarised in the Table 1.

Grade	Area (ha)	% Surveyed Area (3.8 ha)
2	1.8	47
3b	2.0	53
Total site area	3.8	

Table 1:	Distribution of ALC grades: Abenhall Lane, Mitcheldean
----------	--

6. This shows that 47 % of the area was found to be Grade 1 with a minor limitation due to restricted workability, although the rest of the site was found to be Subgrade 3b limited by gradient.

CLIMATE

7. Estimates of climatic variables for this site were derived from the published agricultural climate dataset "Climatological Data for Agricultural Land Classification" (Meteorological Office, 1989) using standard interpolation procedures. Data for key points around the site are given in Table 2 below.

8. Since the ALC grade of land is determined by the most limiting factor present, overall climate is considered first because it can have an overriding influence by restricting land to a lower grade despite more favourable site and soil conditions. Parameters used for assessing overall climate are accumulated temperature, a measure of relative warmth and average annual rainfall, a measure of overall wetness. The results shown in Table 2 indicate that there is no overall climatic limitation.

9. Climatic variables also affect ALC grade through interactions with soil conditions. The most important interactive variables are Field Capacity Days (FCD) which are used in assessing soil wetness and potential Moisture Deficits calculated for wheat and potatoes, which are compared with the moisture available in each profile in assessing soil droughtiness limitations. These are described in later section.

Table 2: C	Climatic Interpolations:	Abenhall Lane, Mitcheldean
------------	--------------------------	----------------------------

Grid Reference	SO667183	SO666181		
Altitude (m)	140	160		
Accumulated Temperature (day °C)	1368	1345		
Average Annual Rainfall (mm)	821	834		
Overall Climatic Grade	1	1		
Field Capacity Days	180	182		
Moisture deficit (mm): Wheat	86	83		
Potatoes	72	68		

RELIEF

10. Altitude ranges from 135 metres at Silver Street to 165 metres at the top of the Abenhall Lane site with some moderate slopes which are not limiting, but also stronger slopes which limit large parts of the site to Subgrade 3b.

GEOLOGY AND SOILS

11. The underlying geology of the site is shown on the published geology map (IGS 1975) as Lower Old Red Sandstone and this was confirmed by the current survey.

12. Soils were mapped by the Soil Survey of England and Wales at a reconnaissance scale of 1:250 000 (SSEW, 1983) as Eardiston 1 Association which is described as comprising well drained reddish coarse loamy soils over sandstone which may be shallow in places especially on brows. This description was entirely borne out by the findings of the current survey. More detailed soils information is also available in the published 1: 25 000 scale survey of Cinderford (SSEW 1981) which shows mainly Ross series with some Flaxley series in the west.

AGRICULTURAL LAND CLASSIFICATION

13. The distribution of ALC grades found by the current survey is shown on the accompanying 1: 10 000 scale map and areas are summarised in Table 1. The detail of information shown at this scale is appropriate to the intensity of field survey but could be misleading if enlarged or applied to small areas.

Grade 2

14. The areas shown as Grade 2 were found to have mainly medium sandy loam topsoil, but with some sandy clay loam, all at Wetness Class I with no evidence of wetness. This variation in topsoil texture was confirmed by the PSD analysis of one sample, which found sandy clay loam, so the whole area is shown as Grade 2 as at least some of the area was found to have a minor limitation due to restricted workability. The subsoils in particular were found to be highly variable, repeatedly ranging in texture from clay to loamy medium sand. Not all such minor variations have been recorded in the profile notes.

15. Although not strictly limiting to ALC, much of this area shown as Grade 2 has slopes approaching 7° .

Subgrade 3b

16. The area shown as Subgrade 3b was found to have slopes of $8 - 11^{\circ}$ with one small area in the Gloucester Road site with slopes of up to 14° which would be Grade 4, but this has not been identified as a separate mapping unit.

APPENDIX I

DESCRIPTION OF GRADES AND SUBGRADES

Grade 1 - excellent quality agricultural land

Land with no or very minor limitations to agricultural use. A very wide range of agricultural and horticultural crops can be grown and commonly include top fruit, soft fruit, salad crops and winter harvested vegetables. Yields are high and less variable than on land of lower quality.

Grade 2 - very good quality agricultural land

Land with minor limitations which affect crop yield, cultivations or harvesting. A wide range of agricultural and horticultural crops can usually be grown but on some land in the grade there may be reduced flexibility due to difficulties with the production of the more demanding crops such as winter harvested vegetables and arable root crops. The level of yield is generally high but may be lower or more variable than Grade 1.

Grade 3 - good to moderate quality agricultural land

Land with moderate limitations which affect the choice of crops, timing and type of cultivation, harvesting or the level of yield. Where more demanding crops are grown yields are generally lower or more variable than on land in Grades 1 and 2.

Subgrade 3a - good quality agricultural land

Land capable of consistently producing moderate to high yields of a narrow range of arable crops, especially cereals, or moderate yields of a wide range of crops including cereals, grass, oilseed rape, potatoes, sugar beet and the less demanding horticultural crops.

Subgrade 3b - moderate quality agricultural land

Land capable of producing moderate yields of a narrow range of crops, principally cereals and grass, or lower yields of a wider range of crops or high yields of grass which can be grazed or harvested over most of the year.

Grade 4 - poor quality agricultural land

Land with severe limitations which significantly restrict the range of crops and/or level of yields. It is mainly suited to grass with occasional arable crops (eg cereals and forage crops) the yields of which are variable. In most climates, yields of grass may be moderate to high but there may be difficulties in utilisation. The grade also includes very droughty arable land.

Grade 5 - very poor quality agricultural land

Land with very severe limitations which restrict use to permanent pasture or rough grazing, except for occasional pioneer forage crops.

APPENDIX II

DEFINITION OF SOIL WETNESS CLASSES

Soil wetness is classified according to the depth and duration of waterlogging in the soil profile.

Wetness Class I

The soil profile is not wet within 70 cm depth for more than 30 days in most years.

Wetness Class II

The soil profile is wet within 70 cm depth for 31-90 days in most years or, if there is no slowly permeable layer within 80 cm depth, it is wet within 70 cm for more than 90 days, but not wet within 40 cm depth for more than 30 days in most years.

Wetness Class III

The soil profile is wet within 70 cm depth for 91-180 days in most years or, if there is no slowly permeable layer within 80 cm depth, it is wet within 70 cm for more than 180 days, but only wet within 40 cm depth for between 31 and 90 days in most years.

Wetness Class IV

The soil profile is wet within 70 cm depth for more than 180 days but not within 40 cm depth for more than 210 days in most years or, if there is no slowly permeable layer within 80 cm depth, it is wet within 40 cm depth for 91-210 days in most years.

Wetness Class V

The soil profile is wet within 40 cm depth for 211-335 days in most years.

Wetness Class VI

The soil profile is wet within 40 cm depth for more than 335 days in most years.

Notes: The number of days specified is not necessarily a continuous period.

'In most years' is defined as more than 10 out of 20 years.

1

ABBREVIATIONS AND TERMS USED IN SURVEY DATA

Soil pit and auger boring information collected during ALC survey is held on a computer database and is reproduced in this report. Terms used and abbreviations are set out below. These conform to definitions contained in the Soil Survey Field Handbook (Hodgson, 1997).

1. Terms used on computer database, in order of occurrence.

GRID REF: National 100 km grid square and 8 figure grid reference.

LAND USE: At the time of survey

WHT:	Wheat	SBT:	Sugar Beet	HTH:	Heathland
BAR:	Barley	BRA:	Brassicas	BOG:	Bog or Marsh
OAT:	Oats	FCD:	Fodder Crops	DCW:	Deciduous Wood
CER:	Cereals	FRT:	Soft and Top Fruit	CFW:	Coniferous Woodland
MZE:	Maize	HRT:	Horticultural Crops	PLO:	Ploughed
OSR:	Oilseed Rape	LEY:	Ley Grass	FLW:	Fallow (inc. Set aside)
POT:	Potatoes	PGR:	Permanent Pasture	SAS:	Set Aside (where known)
LIN:	Linseed	RGR:	Rough Grazing	OTH:	Other
BEN:	Field Beans	SCR:	Scrub		

GRDNT: Gradient as estimated or measured by hand-held optical clinometer.

GLEY, SPL: Depth in centimetres to gleying or slowly permeable layer.

AP (WHEAT/POTS):	Crop-adjusted available water capacity.				
MB (WHEAT/POTS):	Moisture Balance. MD)	(Crop adjusted AP - crop potential			

DRT: Best grade according to soil droughtiness.

If any of the following factors are considered significant, 'Y' will be entered in the relevant column.

MREL EXP: CHEM	Exposure limitation	n Fl	LOOD: ROST:	Flood risk Frost prone	EROS DIST:	
LIMÍT	: The main limi used.	tation to	land qua	lity: The foll	owing a	bbreviations are
OC:	Overall Climate	AE:	Aspect	EX	(: E	xposure
FR:	Frost Risk	GR:	Gradien	t M	R: M	licrorelief

FL:	Flood Risk	TX:	Topsoil Texture	DP:	Soil Depth
CH:	Chemical	WE:	Wetness	WK:	Workability
DR:	Drought	ER:	Erosion Risk	WD:	Soil
					Wetness/Droughtiness

ST: Topsoil Stoniness

TEXTURE: Soil texture classes are denoted by the following abbreviations:-

S: SZL:	Sand Sandy Silt Loam	LS: CL:	Loamy Sand Clay Loam	SL: ZCL	Sandy Loam Silty Clay Loam
ZL:	Silt Loam	SCL:	Sandy Clay	C:	Clay
			Loam		
SC:	Sandy clay	ZC:	Silty clay	OL:	Organic Loam
P:	Peat	SP:	Sandy Peat	LP:	Loamy Peat
PL:	Peaty Loam	PS:	Peaty Sand	MZ:	Marine Light Silts

For the sand, loamy sand, sandy loam and sandy silt loam classes, the predominant size of sand fraction will be indicated by the use of the following prefixes:-

- **F:** Fine (more than 66% of the sand less than 0.2mm)
- M: Medium (less than 66% fine sand and less than 33% coarse sand)
- C: Coarse (more than 33% of the sand larger than 0.6mm)

The clay loam and silty clay loam classes will be sub-divided according to the clay content: M: Medium (< 27% clay) H: heavy (27 - 35% clay)

MOTTLE COL: Mottle colour using Munsell notation.

MOTTLE ABUN: Mottle abundance, expressed as a percentage of the matrix or surface described.

F: few <2% C: common 2 - 20% M: many 20 - 40% VM: very many 40%+

MOTTLE CONT: Mottle contrast

- **F:** faint indistinct mottles, evident only on close inspection
- D: distinct mottles are readily seen
- **P:** Prominent mottling is conspicuous and one of the outstanding features of the horizon.

PED. COL: Ped face colour using Munsell notation.

GLEY: If the soil horizon is gleyed a 'Y' will appear in this column. If slightly gleyed, an 'S' will appear.

STONE LITH: Stone Lithology - One of the following is used.

HR: All hard rocks and stones SLST: Soft oolitic or dolimitic limestone

9

CH:	Chalk	FSST:	Soft, fine grained sandstone
ZR:	Soft, argillaceous, or silty rocks	GH:	Gravel with non-porous (hard) stones
MSST:	Soft, medium grained sandstone	GS:	Gravel with porous (soft) stones
SI:	Soft weathered igneous or metamor	rphic rock	-

Stone contents are given in % by volume for sizes >2cm, >6cm and total stone >2mm.

STRUCT: The degree of development, size and shape of soil peds are described using the following notation

Degree of development	WA: Adher	· J ··· I	WK:	Weakly developed
	MD: develo	Moderately oped	ST:	Strongly developed
<u>Ped size</u>	F: C:	Fine Coarse	M: VC:	Medium Very coarse
<u>Ped Shape</u>	S: GR: SAB: PL:	Single grain Granular Sub-angular blocky Platy	M: AB: PR:	Massive Angular blocky Prismatic

CONSIST: Soil consistence is described using the following notation:

L:	Loose	VF:	Very Friable	FR:	Friable	FM:	Firm
VM:	Very firm	EM:	Extremely firm		EH: Ext	remely H	lard

SUBS STR: Subsoil structural condition recorded for the purpose of calculating profile droughtiness: G: Good M: Moderate P: Poor

POR: Soil porosity. If a soil horizon has poor porosity with less than 0.5% biopores >0.5mm, a 'Y' will appear in this column.

IMP: If the profile is impenetrable to rooting a 'Y' will appear in this column at the appropriate horizon.

SPL: Slowly permeable layer. If the soil horizon is slowly permeable a 'Y' will appear in this column.

CALC: If the soil horizon is calcareous with naturally occurring calcium carbonate exceeding 1% a 'Y' will appear this column.

2. Additional terms and abbreviations used mainly in soil pit descriptions.

STONE ASSESSMENT:

VIS: Visual S: Sieve D: Displacement

١

MOTTLE SIZE:

İ

;;

i

EF:	Extremely fine <1mm	M :	Medium 5-15mm
VF:	Very fine 1-2mm>	C:	Coarse >15mm
F:	Fine 2-5mm		

MOTTLE COLOUR:May be described by Munsell notation or as ochreous
(OM) or grey (GM).ROOT CHANNELS:In topsoil the presence of 'rusty root channels' should
also be noted.

MANGANESE CONCRETIONS: Assessed by volume

N:	None		M :	Many	20-40%
F:	Few	<2%	VM:	Very Many	>40%
C:	Common	2-20%			

POROSITY:

P:	Poor	- less than 0.5% biopores at least 0.5mm in diameter
-----------	------	--

G: Good - more than 0.5% biopores at least 0.5mm in diameter

ROOT ABUNDANCE:

The number of	of roots per 100cm ² :	Very Fine and Fine	Medium and Coarse
F:	Few	1-10	1 or 2
