July 1994

AGRICULTURAL LAND CLASSIFICATION REPORT

MAIDSTONE BOROUGH LOCAL PLAN SITE 8 LAND ADJACENT TO SALT'S AVENUE, LOOSE

1 Summary

- ADAS was commissioned by MAFF's Land Use Planning Unit to provide information on land quality for a number of sites in the borough of Maidstone in Kent The work forms part of MAFF's statutory input to the preparation of the Maidstone Borough Local Plan
- Site 8 comprises approximately 13 hectares of land to the north of Salt's Avenue south of the village of Loose An Agricultural Land Classification (ALC) survey was carried out during July 1994. The survey was undertaken at a detailed level of approximately one boring per hectare. A total of 11 borings and one soil inspection pit were described in accordance with MAFF's revised guidelines and criteria for grading the quality of agricultural land (MAFF 1988). These guidelines provide a framework for classifying land according to the extent to which its physical or chemical characteristics impose a long term limitation on its use for agriculture
- The work was carried out by members of the Resource Planning Team in the Guildford Statutory Group of ADAS
- 1 4 At the time of survey the agricultural land on the site was overgrown unmanaged rough grassland. An area of non agricultural land exists in the west of the site consisting of scrub and semi mature trees
- The distribution of grades and subgrades is shown on the attached ALC map and the areas are given in the table below. The map has been drawn at a scale of 1 10 000. It is accurate at this scale but any enlargement would be misleading.

Table 1 Distribution of Grades and Subgrades

Grade	Area (ha)	% of Site	% of Agricultural Land					
3a	3 1	23 9	27 0					
3b	8 4	64 6	73 0					
Non-agricultural	1 5	11 5	<u>100%</u> (11 5 ha)					
Total area of site	<u>13 0</u>	<u>100%</u>	,					

Appendix I gives a general description of the grades subgrades and land use categories identified in the survey. The main classes are described in terms of the type of limitation that can occur the typical cropping range and the expected level and consistency of yield

The majority of the agricultural land on the site has been classified as Subgrade 3b moderate quality with soil wetness as the main limitation. All of the borings in this mapping unit proved impenetrable below the topsoil. A subsequent soil inspection pit showed the existence of a slowly permeable clay subsoil becoming stonier with depth, which significantly impedes soil drainage. The remainder of the agricultural land on the site has been classified as Subgrade 3a good quality land, with soil droughtiness as the main limitation. Soils in this mapping unit tend to be of a lighter texture better drained and less stony than elsewhere on the site. However, these soils show a a moderate droughtiness limitation due to a combination of soil textures structures and the local climatic regime causing a restriction on profile available water.

2 Climate

- The climatic criteria are considered first when classifying land as climate can be overriding in the sense that severe limitations will restrict land to low grades irrespective of favourable site or soil conditions
- The main parameters used in the assessment of an overall climatic limitation are average annual rainfall as a measure of overall wetness and accumulated temperature (degree days Jan June) as a measure of the relative warmth of a locality
- A detailed assessment of the prevailing climate was made by interpolation from a 5km gridpoint dataset (Met Office 1989). The details are given in the table below and these show that there is no overall climatic limitation affecting the site. However, the field capacity days for the site are relatively low in a regional context and therefore the likelihood of any soil wetness problems may be decreased.
- 2.4 No local climatic factors such as exposure or frost risk are believed to affect the site

Table 2 Climatic Interpolations

Grid Reference	TQ 760516	TQ 760513
Altitude (m)	85	100
Accumulated Temperature	1418	1395
(degree days Jan-June)		
Average Annual Rainfall (mm)	696	703
Field Capacity (days)	141	142
Moisture Deficit Wheat (mm)	114	112
Moisture Deficit Potatoes (mm)	109	106
Overall Climatic Grade	1	1

3 Relief

The site lies at an altitude ranging between 80-100 m AOD. A gently sloping dry valley feature runs north south towards the east of the site. Nowhere on the site do gradient or relief affect agricultural land quality.

4 Geology and Soil

- 4 i The relevant geological sheet (BGS 1976) shows the entire site to be underlain by Hythe Beds
- The published Soil Survey map (SSEW 1983) shows the soils on the site to comprise those of the Malling association. These soils are described as well drained non-calcareous fine loamy soils over limestone at variable depths. Some fine loamy soils with slowly permeable subsoils with slight seasonal waterlogging (SSEW 1983).
- 4 3 Detailed field examination found the soils over much of the site to be impenetrable at shallow depths with a slowly permeable clay subsoil interbedded with limestone over much of the site

5 Agricultural Land Classification

- Table 1 provides the details of the area measurements for each grade and the distribution of each grade is shown on the attached ALC map
- The location of the soil observation points are shown on the attached sample point map

Subgrade 3a

Good quality land has been mapped towards the west of the site running in a band from north to south along a dry valley feature. Soil profiles tend to comprise a slightly stony (10.15% total hard limestone) medium silty clay loam topsoil overlying a similarly textured very slightly stony (2-5% total hard limestone) upper subsoil which rests upon a heavy silt clay loam lower subsoil. Lower subsoils are variably stony (5.25% total hard limestone) proving impenetrable to the auger at depths of between 60.100cm. Some of the profiles within this mapping unit show evidence of a slight wetness imperfection in the form of gleying although subsoils tend not to be slowly permeable. A combination of soil textures structures stone contents and the local climatic regime means that there is a moderate restriction on the amount of profile available water for plant growth. This will have a consequent effect upon crop yields such that a classification of Subgrade 3a is appropriate.

Subgrade 3b

- 5 4 Agricultural land on the remainder of the site has been classified as Subgrade 3b moderate quality land Soil augerings within this mapping unit proved to be impenetrable below a variably stony non-calcareous medium silty clay loam topsoil at depths of between 30 35 cm. A subsequent soil inspection pit (Pit no. 1) was dug towards the east of the site to assess the nature of the subsoil. The soil profile was found to comprise a slightly stony (15% total hard limestone 8%> 2cm in size) medium silty clay loam topsoil. This overlies a similar textured moderately stony (25% total hard limestone) upper subsoil which in turn rests upon a clay lower subsoil commencing at 35cm The clay horizon varies in stone content being moderately stony (20% total hard limestone) to a depth of 85cm and very stony (40% total hard limestone) below this Limestone in the subsoil tends to be flaggy in nature and sandy intercalations were found to be present within the soil matrix. The clay shows signs of wetness in the form of gleying and the less stony clay horizon was found to be poorly structured and slowly permeable thereby impeding drainage. Such drainage characteristics equate this soil profile to Wetness Class IV with a resultant classification of Subgrade 3b Poorly drained wet soils can inhibit plant growth and development and can also be susceptible to structural damage through trafficking by agricultural machinery and poaching by grazing livestock
- The impenetrable nature of the soils on this site means that a number of assumptions have had to be made drawn from observations made at pit no 1 regarding the classification of land elsewhere on the site. It has been assumed that a worst case scenario of a slowly permeable clay subsoil at shallow depths prevails within this mapping unit such that an overall classification of Subgrade 3b is appropriate.

APPENDIX I

DESCRIPTION OF THE GRADES AND SUBGRADES

Grade 1 Excellent Quality Agricultural Land

Land with no or very minor limitations to agricultural use. A very wide range of agricultural and horticultural crops can be grown and commonly includes top fruit soft fruit salad crops and winter harvested vegetables. Yields are high and less variable than on land of lower quality.

Grade 2 Very Good Quality Agricultural Land

Land with minor limitations which affect crop yield cultivations or harvesting. A wide range of agricultural or horticultural crops can usually be grown but on some land of this grade there may be reduced flexibility due to difficulties with the production of the more demanding crops such as winter harvested vegetables and arable root crops. The level of yield is generally high but may be lower or more variable than Grade 1 land.

Grade 3 Good to Moderate Quality Land

Land with moderate limitations which affect the choice of crops the timing and type of cultivation harvesting or the level of yield. When more demanding crops are grown yields are generally lower or more variable than on land in Grades 1 and 2

Subgrade 3a Good Quality Agricultural Land

Land capable of consistently producing moderate to high yields of a narrow range of arable crops especially cereals or moderate yields of a wide range of crops including cereals grass oilseed rape potatoes sugar bect and the less demanding horticultural crops

Subgrade 3b Moderate Quality Agricultural Land

Land capable of producing moderate yields of a narrow range of crops principally cereals and grass or lower yields of a wider range of crops or high yields of grass which can be grazed or harvested over most of the year

Grade 4 Poor Quality Agricultural Land

Land with severe limitations which significantly restrict the range of crops and/or the level of yields. It is mainly suited to grass with occasional arable crops (eg. cereals and forage crops) the yields of which are variable. In moist climates, yields of grass may be moderate to high but there may be difficulties in utilisation. The grade also includes very droughty arable land.

Grade 5 Very Poor Quality Agricultural Land

Land with severe limitations which restrict use to permanent pasture or rough grazing except for occasional pioneer forage crops

Urban

Built up or 'hard' uses with relatively little potential for a return to agriculture including housing industry commerce education transport religous buildings cemetries. Also hard surfaced sports facilities permanent caravan sites and vacant land all types of derelict land including mineral workings which are only likely to be reclaimed using derelict land grants.

Non-agricultural

'Soft uses where most of the land could be returned relatively easily to agriculture including private parkland public open spaces sports fields allotments and soft surfaced areas on airports. Also active mineral workings and refuse tips where restoration conditions to soft after-uses may apply

Woodland

Includes commercial and non commercial woodland A distinction may be made as necessary between farm and non farm woodland

Agricultural Buildings

Includes the normal range of agricultural buildings as well as other relatively permanent structures such as glasshouses Temporary structures (eg polythene tunnels erected for lambing) may be ignored

Open Water

Includes lakes ponds and rivers as map scale permits

Land Not Surveyed

Agricultural land which has not been surveyed

ļ

Where the land use includes more than one of the above eg buildings in large grounds and where map scale permits the cover types may be shown separately. Otherwise the most extensive cover type will be shown

APPENDIX II

FIELD ASSESSMENT OF SOIL WETNESS CLASS

SOIL WETNESS CLASSIFICATION

Soil wetness is classified according to the depth and duration of waterlogging in the soil profile. Six soil wetness classes are identified and are defined in the table below

Definition of Soil Wetness Classes

Wetness Class	Duration of Waterlogging ¹								
1	The soil profile is not wet within 70 cm depth for more than 30 days in most years 2								
и	The soil profile is wet within 70 cm depth for 31-90 days in most years or if there is no slowly permeable layer within 80 cm depth it is wet within 70 cm for more than 90 days but only wet within 40 cm depth for 30 days in most years								
ш	The soil profile is wet within 70 cm depth for 91 180 days in most years or if there is no slowly permeable layer present within 80 cm depth it is wet within 70 cm for more than 180 days but only wet within 40 cm depth for between 31-90 days in most years								
IV	The soil profile is wet within 70 cm depth for more than 180 days but not wet within 40 cm depth for more than 210 days in most years or if there is no slowly permeable layer present within 80 cm depth it is wet within 40 cm depth for 91 210 days in most years								
V	The soil profile is wet within 40 cm depth for 211 335 days in most years								
VI	The soil profile is wet within 40 cm depth for more than 335 days in most years								

Soils can be allocated to a wetness class on the basis of quantitative data recorded over a period of many years or by the interpretation of soil profile characteristics site and climatic factors. Adequate quantitative data will rarely be available for ALC surveys and therefore the interpretative method of field assessment is used to identify soil wetness class in the field. The method adopted here is common to ADAS and the SSLRC

ĺ

¹The number of days specified is not necessarily a continuous period

² In most years is defined as more than 10 out of 20 years

SOIL PROFILE DESCRIPTIONS EXPLANATORY NOTE

Soil pit and auger boring information collected during ALC fieldwork is held on a computer database. This uses notations and abbreviations as set out below

Boring Header Information

- 1 GRID REF national 100 km grid square and 8 figure grid reference
- 2 USE Land use at the time of survey. The following abbreviations are used

ARA	Arable	WHI	Wheat	BAR	Barley
CER	Cereals	CAO	Onts	MZE	Maize
OSR	Oilseed rape	BEN	Field Beans	BRA	Brassicae
POT	Potrtoes	SBI	Sugar Beet	FCD	I odder Crops
LIN	Linsced	IRI	Soft and Top Fruit	FLW	Fallow
PGR	Permanent Pasture	LLY	Lcy Grass	RGR	Rough Grazing
SCR	Scrub	CI W	Conferous Woodland	DCW	Deciduous Wood
HTH	Heathl ind	BOG	Bog or Marsh	FLW	Fallow
PLO	Ploughed	SAS	Set aside	OTH	Other
HRT	Horticultural Crop	S			

ſ

- 3 GRDNT Gradient as estimated or measured by a hand held optical clinometer
- GLEY/SPL Depth in centimetres (cm) to gleying and/or slowly permeable layers 4
- 5 AP (WHLAT/POTS) Crop adjusted available water capacity
- MB (WHEAT/POIS) Moisture Balance (Crop adjusted AP crop adjusted MD) 6
- 7 DRT Best grade according to soil droughtiness
- 8 If any of the following factors are considered significant Y will be entered in the relevant column

MREL	Microrelief limitation	Γ LOOD	Flood risk	EROSN	Soil erosion risk
EXP	Exposure limitation	FROST	Frost prone	DIST	Disturbed land
CHEM	Chemical limitation				

9 LIMIT The main limitation to land quality The following abbreviations are used

OC	Overall Climate	ΑE	Aspect	$\mathbf{E}\mathbf{X}$	Exposure
FR	Frost Risk	GR	Gradient	MR	Microrelief
HL	Flood Risk	11	Topsoil Texture	DP	Soil Depth
CH	Chemical	WŁ	Wetness	WK	Workability
DR	Drought	ER	Lrosion Risk	WD	Soil Wetness/Droughtiness
ST	Topsoil Stonine	SS			

Soil Pits and Auger Borings

1 TEXTURE soil texture classes are denoted by the following abbreviations

S	Sand	LS	Loamy Sand	SL	Sandy Loam
SZL	Sandy Silt Loam	CL	Clay Loam	ZCL	Silty Clay Loam
ZL	Silt Loam	SCL	Sandy Clay Loam	C	Clay
SC	Sandy Clay	ZC	Silty Clay	OL	Organic Loam
P	Peat	SP	Sandy Peat	LP	Loamy Peat
PL	Peaty Loam	PS	Peaty Sand	MZ	Marine Light Silts

For the sand loamy sand sandy loam and sandy silt loam classes the predominant size of sand fraction will be indicated by the use of the following prefixes

- Fine (more than 66% of the sand less than 0 2mm)
- M Medium (less than 66% fine sand and less than 33% coarse sand)
- C Coarse (more than 33% of the sand larger than 0 6mm)

The clay loam and silty clay loam classes will be sub divided according to the clay content M Medium (<27% clay) H Heavy (27-35% clay)

- 2 MOTTLE COL Mottle colour using Munsell notation
- 3 MOTTLE ABUN Mottle abundance expressed as a percentage of the matrix or surface described

F few <2% C common 2 20% M many 20-40% VM very many 40% +

4 MOTTLE CONΓ Mottle contrast

ł

- Γ faint indistinct mottles evident only on close inspection
- D distinct mottles are readily seen
- P prominent mottling is conspicuous and one of the outstanding features of the horizon
- 5 PLD COL Ped face colour using Munsell notation
- 6 GLEY If the soil horizon is gleyed a Y will appear in this column. If slightly gleyed an S will appear
- 7 STONE LITH Stone Lithology One of the following is used

HR	all hard rocks and stones	SLST	soft oolitic or dolimitic limestone
CH	chalk	FSST	soft fine grained sandstone
ZR	soft argillaceous or silty rocks	GH	gravel with non porous (hard) stones
MSST	soft medium grained sandstone	GS	gravel with porous (soft) stones
SI	soft weathered igneous/metamo	orphic ro	ck

Stone contents (>2cm >6cm and total) are given in percentages (by volume)

8 STRUCT the degree of development size and shape of soil peds are described using the following notation

degree of development WK weakly developed MD moderately developed

ST strongly developed

ped size F fine M medium

C coarse VC very coarse

ped shape S single grain M massive

GR granular AB angular blocky

SAB sub angular blocky PR prismatic

PL platy

9 CONSIST Soil consistence is described using the following notation

L loose VF very friable IR friable FM firm VM very firm

EM extremely firm EH extremely hard

10 SUBS STR Subsoil structural condition recorded for the purpose of calculating profile droughtiness G good M moderate P poor

- POR Soil porosity If a soil horizon has less than 0.5% biopores >0.5 mm a Y will appear in this column
- 12 IMP If the profile is impenetrable to rooting a Y will appear in this column at the appropriate horizon
- 13 SPL Slowly permeable layer If the soil horizon is slowly permeable a Y will appear in this column
- 14 CALC If the soil horizon is calcareous a Y' will appear in this column
- 15 Other notations

APW available water capacity (in mm) adjusted for wheat

APP available water capacity (in mm) adjusted for potatoes

MBW moisture balance wheat

MBP moisture balance potatoes
