## **AGRICULTURAL LAND CLASSIFICATION SURVEY**

### **INTRODUCTION**

1 This report presents the findings of a detailed Agricultural Land Classification (ALC) survey of 63.8 ha of two blocks of land at Manor Farm Lechlade. Field survey was based on 33 auger borings and 4 soil profile pits and was completed in November 1998.

2 The survey was conducted by the Resource Planning Team of FRCA Western Region on behalf of MAFF in its statutory role in connection with an application to the Planning Authority under the Town and Country Planning Act 1990 for creation of a lake complex known as Claydon Pike.

3 Information on climate, geology and soils and from previous ALC surveys was considered and is presented in the relevant section. Apart from the published regional ALC map (MAFF 1977) which shows the sites at a reconnaissance scale as Grade 2 with a small area of Grade 3 in the SW corner of the southern block, the site had not been surveyed previously. The current survey uses the Revised Guidelines and Criteria for grading the quality of agricultural land (MAFF 1988) and supersedes any previous ALC survey. Grade descriptions are summarised in Appendix I.

4 The northern block had previously been worked for gravel. The western part of this area was restored to agricultural use in two phases. The most westerly field was reported to have been restored six years ago and to the east four years ago. The eastern section of the block has not been restored to agricultural use and no ALC grade has been assigned to this area. Since soils which have been disturbed will often have a weakened soil structure which can take many years to return to a stable condition, the grading which has been applied to the restored areas should be considered as an interim grading. The ALC system assumes that where underdrainage can be installed, then the land will be classified as if the drainage were in place. The first phase of restoration is reportedly underdrained but the second is not. The southern block of land was undisturbed at the time of survey.

5 An area to the west of the current survey was surveyed in 1990 (ADAS 1990). This showed poorly drained Subgrade 3b land along the River Coln and droughty Grade 2 land elsewhere.

6 At the time of survey, land cover was grassland in the west of the restored block and arable stubble on the rest of the restored land. The southern block was also in arable production. The area not restored to agriculture was not surveyed, neither was a small copse in the southern area.

### **SUMMARY**

7 The distribution of ALC grades is shown on the accompanying 1:10,000 scale ALC map. The detail of information shown at this scale is appropriate to the intensity of field survey but could be misleading if enlarged or applied to small areas. Areas are summarised in the Table 1.

**Table 1      Distribution of ALC grades    Claydon Pike**

| <b>Grade</b>    | <b>Area (ha)</b> | <b>% Surveyed Area (42.5 ha)</b> |
|-----------------|------------------|----------------------------------|
| 3a              | 35.3             | 83                               |
| 3b              | 7.2              | 17                               |
| Other land      | 21.3             |                                  |
| Total site area | 63.8             |                                  |

**Table 1a      Distribution of ALC grades    Claydon Pike (northern block)**

| <b>Grade</b>    | <b>Area (ha)</b> | <b>% Surveyed Area (27.8 ha)</b> |
|-----------------|------------------|----------------------------------|
| 3a              | 27.8*            | 100                              |
| Unrestored land | 19.5             |                                  |
| Other land      | 1.3              |                                  |
| Total area      | 48.6             |                                  |

\* of which 10.0 ha is Zone 1 and 17.8 ha is Zone 2 restoration

**Table 1b      Distribution of ALC grades    Claydon Pike (southern block)**

| <b>Grade</b>    | <b>Area (ha)</b> | <b>% Surveyed Area (14.7 ha)</b> |
|-----------------|------------------|----------------------------------|
| 3a              | 7.5              | 51                               |
| 3b              | 7.2              | 49                               |
| Other land      | 0.5              |                                  |
| Total site area | 15.2             |                                  |

8      All of the restored land has been mapped as Subgrade 3a primarily with a moderate wetness limitation. The heavy clay loam soils even with underdrainage installed would remain wet for part of the year. The soil become increasingly stony with depth and have minor and moderate droughtiness limitations. The undisturbed soil in the south is partly mapped as Subgrade 3a again with a moderate wetness limitation and partly Subgrade 3b where the stonier soils experience a moderate droughtiness limitation. Part of the northern block has not been restored to agricultural use and has not been classified.

## **CLIMATE**

9      Estimates of climatic variables for this site were derived from the published agricultural climate dataset 'Climatological Data for Agricultural Land Classification' (Meteorological Office 1989) using standard interpolation procedures. Data for key points around the site are given in Table 2 below.

10 Since the ALC grade of land is determined by the most limiting factor present overall climate is considered first because it can have an overriding influence by restricting land to a lower grade despite more favourable site and soil conditions Parameters used for assessing overall climate are accumulated temperature a measure of relative warmth and average annual rainfall a measure of overall wetness The results shown in Table 2 indicate that there is no overall climatic limitation

11 Climatic variables also affect the ALC grade through interactions with soil conditions The most important interactive variables are Field Capacity Days (FCD) which are used in assessing soil wetness and potential Moisture Deficits calculated for wheat and potatoes which are compared with the moisture available in each profile in assessing soil droughtiness limitations These are described in later sections

**Table 2 Climatic Interpolations Claydon Pike**

| Grid Reference                   | SU 180 999 | SU 195 990 |
|----------------------------------|------------|------------|
| Altitude (m)                     | 75         | 75         |
| Accumulated Temperature (day °C) | 1439       | 1438       |
| Average Annual Rainfall (mm)     | 693        | 689        |
| Overall Climatic Grade           | 1          | 1          |
| Field Capacity Days              | 153        | 153        |
| Moisture deficit (mm) Wheat      | 106        | 106        |
| Potatoes                         | 97         | 97         |

## RELIEF

12 Altitude at the sites is around 75m although the restored site is at a lower level than the pre working level The southern undisturbed site is fairly flat whilst the northern site has man made contours At the western side of the site there is an embankment running around the edge which has slopes ranging from 7.5 to over 11 degrees There is an area of flat land on top of the embankment of at least 20m width The slope extends over approximately 20m Land with this gradient is downgraded within the ALC system however because the land involved at this site forms a narrow band it is not shown at the scale of mapping Towards the east of this block the slopes are more gentle

13 The restored site is at a lower level than the original land surface and is below the level of the water table of the surrounding land during some of the year In order to prevent the area flooding the water has to be pumped away The restored area is surrounded by deep ditches The most westerly field has underdrainage installed and at the time of survey (November 1998) the drains were running The surface of this field was wet but beneath the surface the soils were not waterlogged suggesting that the surface wetness was a management problem such as surface compaction which could be alleviated The other restored fields also had standing water on the surface however the whole profile was waterlogged These fields are reportedly not drained There is adequate outfall for underdrainage to function if it were

installed. The ALC system grades land according to the limitation remaining after drainage has been installed (see Paragraphs 19ff)

14 The undisturbed southern block was partly flooded at the eastern end at the time of the survey but the limitation imposed by flood risk from the River Coln is assessed to be no worse than other limitations

## **GEOLOGY AND SOILS**

15 The underlying geology of the site prior to extraction is shown on the published geology map (IGS 1974) as First Terrace gravels over Oxford Clay. The southern fringe of the southern site has alluvial drift deposits. The undisturbed southern block showed evidence of terrace and alluvial deposits. Restoration of the northern block has used material similar to the terrace deposits in the soils profile and occasional bands of clay similar to the parent clay were also found.

16 Soils were mapped by the Soil Survey of England and Wales at a reconnaissance scale of 1:250,000 (SSEW 1983) as Badsey 2 Association prior to disturbance in the northern block. The southern block also showed Badsey 2 with Kelmscot along the southern edge.

17 Badsey 2 Association is described as well drained calcareous fine loamy soils over limestone gravel affected by groundwater. Kelmscot Association are similar soils.

18 The recent survey found soils similar to the described associations. Even the restored land had profiles which were similar to the original undisturbed soils.

## **AGRICULTURAL LAND CLASSIFICATION**

19 The distribution of ALC grades found by the current survey is shown on the accompanying 1:10,000 scale map and areas are summarised in Table 1. The detail of information shown at this scale is appropriate to the intensity of field survey but could be misleading if enlarged or applied to small areas.

### **Subgrade 3a**

20 Part of the undisturbed southern block has been mapped as Subgrade 3a good quality land. These soils experience a moderate wetness limitation imposed by groundwater. The heavy clay loam topsoils lie over increasingly stony subsoils. The subsoils are gleyed reflecting the effect of high watertables for part of the year. These soils are assessed as Wetness Class II.

21 The restored land in the northern block has also been mapped as Subgrade 3a. The grading for this area is based on the current structural conditions. It is recognised that the soil structure is still returning to a more stable and natural structural condition which takes several years to occur. The condition of the soil and its grading therefore may change with time.

22 The western field which forms the first phase of restoration shows some evidence of waterlogging in the soil. The mottling and pale and grey colours may be relic from the previous soil environment. However the matrix colour of the soil is more responsive to the

aerobic condition of the soil than mottling. Mottling can persist even when the conditions which formed it are removed. Nevertheless the presence of the greyish and pale matrix colour in the profiles suggest that there are anaerobic conditions for part of the season in the current profile. Based on the evidence available most of the profiles within this area have been assessed as Wetness Class II (see Appendix II). Generally the typical profile has heavy clay loam topsoils with around 10% small stones over further heavy clay loam horizons with higher stone contents measured as 27% in a soil profile pit. These soils typically have a minor or moderate droughtiness limitations. There are sometimes clay horizons present but often too shallow to be considered as an effective slowly permeable layer. A soil profile pit dug in this area showed that the stony subsoils had moderate structural conditions and were free draining. This area has underdrainage and the drains were freely running.

23 The western part of the site has an embankment running around the edge. The gradient of this area was measured as being over 7 degrees and is thus downgraded to Subgrade 3b. However the sloping land forms a narrow band some 20 metres in width which at the scale of mapping is not shown on the accompanying ALC map. This land accounts for about 2 ha in area. The versatility of this land is restricted particularly in the west where there is a ditch running along the bottom of the slope. The land on the top of the embankment although it is also a narrow band could be farmed as Subgrade 3a since cultivations could take place parallel to the field boundary.

24 The second phase of restoration which forms the rest of the restored land shows less evidence of waterlogging in the soil than the first phase but the soil profile at the time of survey was waterlogged to within 30-40cm of the surface. This part of the site is reportedly not drained. The installation of underdrainage would alleviate the high water table and improve the soil wetness regime as indicated by the first phase of restoration. The ditches around the site would provide sufficient outfall for the ground water level to be lowered such that the soils could be classified as Wetness Class II i.e. the soil is wet within 70cm for more than 90 days but not wet within 40cm depth for more than 30 days in most years. These soils are therefore classified as Subgrade 3a with a moderate wetness limitation. Should the site remain undrained the profiles would be assessed as Wetness Class IV and Subgrade 3b however the ALC system assumes the land would be drained.

25 The soils in this second phase area were typically heavy clay loams down the profile but with around 15-20% stone in the topsoil and variable stone contents in the subsoil. At two soil profile pits dug in this area the subsoil contents were measured as over 40% and 60%. Some profiles also have a moderate droughtiness limitation where the higher stone contents are found. Some of the soil profiles also have clay bands which can be thick enough to be slowly permeable and too deep in the profile to be removed and are Subgrade 3b.

### **Subgrade 3b**

26 Part of the undisturbed southern block has been mapped as Subgrade 3b moderate quality land. These soils experience a moderate droughtiness limitation. The subsoils are very stony 55% measured in a soil profile pit. The soil matrix is a lighter texture loamy medium sand than that found in the restored soils in the north and this restricts the available water in the profile. The water table was high within this area and the soils have been assessed as Wetness Class II based on the level of the watertable rather than the usual wetness assessment which would underestimate the affects of the high groundwater. Within this unit there is a

profile where the stony layer is much deeper and would be assessed as Subgrade 3a but the shape of the survey area means that this is included in the lower grade land

### **Other Land**

27 Part of the northern block has not been restored to agricultural use and so is not classified. There is no topsoil present in this area and there are heaps of quarry spoil. The land associated with Manor Farmhouse and Cottage and a small copse on the southern site are mapped as other land.

## **APPENDIX I**

### **DESCRIPTION OF GRADES AND SUBGRADES**

#### **Grade 1 excellent quality agricultural land**

Land with no or very minor limitations to agricultural use. A very wide range of agricultural and horticultural crops can be grown and commonly include top fruit, soft fruit, salad crops and winter harvested vegetables. Yields are high and less variable than on land of lower quality.

#### **Grade 2 very good quality agricultural land**

Land with minor limitations which affect crop yield, cultivations or harvesting. A wide range of agricultural and horticultural crops can usually be grown but on some land in the grade there may be reduced flexibility due to difficulties with the production of the more demanding crops such as winter harvested vegetables and arable root crops. The level of yield is generally high but may be lower or more variable than Grade 1.

#### **Grade 3 good to moderate quality agricultural land**

Land with moderate limitations which affect the choice of crops, timing and type of cultivation, harvesting or the level of yield. Where more demanding crops are grown, yields are generally lower or more variable than on land in Grades 1 and 2.

##### **Subgrade 3a good quality agricultural land**

Land capable of consistently producing moderate to high yields of a narrow range of arable crops, especially cereals, or moderate yields of a wide range of crops including cereals, grass, oilseed rape, potatoes, sugar beet and the less demanding horticultural crops.

##### **Subgrade 3b moderate quality agricultural land**

Land capable of producing moderate yields of a narrow range of crops, principally cereals and grass, or lower yields of a wider range of crops or high yields of grass which can be grazed or harvested over most of the year.

#### **Grade 4 poor quality agricultural land**

Land with severe limitations which significantly restrict the range of crops and/or level of yields. It is mainly suited to grass with occasional arable crops (eg cereals and forage crops) the yields of which are variable. In most climates, yields of grass may be moderate to high but there may be difficulties in utilisation. The grade also includes very droughty arable land.

**Grade 5 very poor quality agricultural land**

Land with very severe limitations which restrict use to permanent pasture or rough grazing except for occasional pine

## **APPENDIX II**

### **DEFINITION OF SOIL WETNESS CLASSES**

Soil wetness is classified according to the depth and duration of waterlogging in the soil profile

#### **Wetness Class I**

The soil profile is not wet within 70 cm depth for more than 30 days in most years

#### **Wetness Class II**

The soil profile is wet within 70 cm depth for 31-90 days in most years or if there is no slowly permeable layer within 80 cm depth it is wet within 70 cm for more than 90 days but not wet within 40 cm depth for more than 30 days in most years

#### **Wetness Class III**

The soil profile is wet within 70 cm depth for 91-180 days in most years or if there is no slowly permeable layer within 80 cm depth it is wet within 70 cm for more than 180 days but only wet within 40 cm depth for between 31 and 90 days in most years

#### **Wetness Class IV**

The soil profile is wet within 70 cm depth for more than 180 days but not within 40 cm depth for more than 210 days in most years or if there is no slowly permeable layer within 80 cm depth it is wet within 40 cm depth for 91-210 days in most years

#### **Wetness Class V**

The soil profile is wet within 40 cm depth for 211-335 days in most years

#### **Wetness Class VI**

The soil profile is wet within 40 cm depth for more than 335 days in most years

**Notes** The number of days specified is not necessarily a continuous period

In most years is defined as more than 10 out of 20 years

## APPENDIX III

### ABBREVIATIONS AND TERMS USED IN SURVEY DATA

Soil pit and auger boring information collected during ALC survey is held on a computer database and is reproduced in this report. Terms used and abbreviations are set out below. These conform to definitions contained in the Soil Survey Field Handbook (Hodgson 1997)

#### 1 Terms used on computer database in order of occurrence

**GRID REF** National 100 km grid square and 8 figure grid reference

**LAND USE** At the time of survey

|            |              |            |                     |            |                         |
|------------|--------------|------------|---------------------|------------|-------------------------|
| <b>WHT</b> | Wheat        | <b>SBT</b> | Sugar Beet          | <b>HTH</b> | Heathland               |
| <b>BAR</b> | Barley       | <b>BRA</b> | Brassicas           | <b>BOG</b> | Bog or Marsh            |
| <b>OAT</b> | Oats         | <b>FCD</b> | Fodder Crops        | <b>DCW</b> | Deciduous Wood          |
| <b>CER</b> | Cereals      | <b>FRT</b> | Soft and Top Fruit  | <b>CFW</b> | Coniferous Woodland     |
| <b>MZE</b> | Maize        | <b>HRT</b> | Horticultural Crops | <b>PLO</b> | Ploughed                |
| <b>OSR</b> | Oilseed Rape | <b>LEY</b> | Ley Grass           | <b>FLW</b> | Fallow (inc Set aside)  |
| <b>POT</b> | Potatoes     | <b>PGR</b> | Permanent Pasture   | <b>SAS</b> | Set Aside (where known) |
| <b>LIN</b> | Linseed      | <b>RGR</b> | Rough Grazing       | <b>OTH</b> | Other                   |
| <b>BEN</b> | Field Beans  | <b>SCR</b> | Scrub               |            |                         |

**GRDNT** Gradient as estimated or measured by hand held optical clinometer

**GLEYSPL** Depth in centimetres to gleying or slowly permeable layer

**AP (WHEAT/POTS)** Crop adjusted available water capacity

**MB (WHEAT/POTS)** Moisture Balance (Crop adjusted AP - crop potential MD)

**DRT** Best grade according to soil droughtiness

If any of the following factors are considered significant Y will be entered in the relevant column

|             |                        |              |             |              |                   |
|-------------|------------------------|--------------|-------------|--------------|-------------------|
| <b>MREL</b> | Microrelief limitation | <b>FLOOD</b> | Flood risk  | <b>EROSN</b> | Soil erosion risk |
| <b>EXP</b>  | Exposure limitation    | <b>FROST</b> | Frost prone | <b>DIST</b>  | Disturbed land    |
| <b>CHEM</b> | Chemical limitation    |              |             |              |                   |

**LIMIT** The main limitation to land quality. The following abbreviations are used

|           |                 |           |                 |           |             |
|-----------|-----------------|-----------|-----------------|-----------|-------------|
| <b>OC</b> | Overall Climate | <b>AE</b> | Aspect          | <b>EX</b> | Exposure    |
| <b>FR</b> | Frost Risk      | <b>GR</b> | Gradient        | <b>MR</b> | Microrelief |
| <b>FL</b> | Flood Risk      | <b>TX</b> | Topsoil Texture | <b>DP</b> | Soil Depth  |

|           |                   |           |              |           |                           |
|-----------|-------------------|-----------|--------------|-----------|---------------------------|
| <b>CH</b> | Chemical          | <b>WE</b> | Wetness      | <b>WK</b> | Workability               |
| <b>DR</b> | Drought           | <b>ER</b> | Erosion Risk | <b>WD</b> | Soil Wetness/Droughtiness |
| <b>ST</b> | Topsoil Stoniness |           |              |           |                           |

**TEXTURE** Soil texture classes are denoted by the following abbreviations

|            |                 |            |                 |            |                    |
|------------|-----------------|------------|-----------------|------------|--------------------|
| <b>S</b>   | Sand            | <b>LS</b>  | Loamy Sand      | <b>SL</b>  | Sandy Loam         |
| <b>SZL</b> | Sandy Silt Loam | <b>CL</b>  | Clay Loam       | <b>ZCL</b> | Silty Clay Loam    |
| <b>ZL</b>  | Silt Loam       | <b>SCL</b> | Sandy Clay Loam | <b>C</b>   | Clay               |
| <b>SC</b>  | Sandy clay      | <b>ZC</b>  | Silty clay      | <b>OL</b>  | Organic Loam       |
| <b>P</b>   | Peat            | <b>SP</b>  | Sandy Peat      | <b>LP</b>  | Loamy Peat         |
| <b>PL</b>  | Peaty Loam      | <b>PS</b>  | Peaty Sand      | <b>MZ</b>  | Marine Light Silts |

For the sand loamy sand sandy loam and sandy silt loam classes the predominant size of sand fraction will be indicated by the use of the following prefixes

|          |  |
|----------|--|
| <b>F</b> | Fine (more than 66% of the sand less than 0.2mm)               |
| <b>M</b> | Medium (less than 66% fine sand and less than 33% coarse sand) |
| <b>C</b> | Coarse (more than 33% of the sand larger than 0.6mm)           |

The clay loam and silty clay loam classes will be sub divided according to the clay content **M** Medium (< 27% clay) **H** heavy (27-35% clay)

**MOTTLE COL** Mottle colour using Munsell notation

**MOTTLE ABUN** Mottle abundance expressed as a percentage of the matrix or surface described

**F** few <2% **C** common 2-20% **M** many 20-40% **VM** very many 40%+

**MOTTLE CONT** Mottle contrast

|          |  |
|----------|--|
| <b>F</b> | faint indistinct mottles evident only on close inspection                            |
| <b>D</b> | distinct mottles are readily seen  |
| <b>P</b> | Prominent mottling is conspicuous and one of the outstanding features of the horizon |

**PED COL** Ped face colour using Munsell notation

**GLEYS** If the soil horizon is gleyed a **Y** will appear in this column If slightly gleyed an **S** will appear

**STONE LITH** Stone Lithology One of the following is used

|             |                                  |             |                                      |
|-------------|----------------------------------|-------------|--------------------------------------|
| <b>HR</b>   | All hard rocks and stones        | <b>SLST</b> | Soft oolitic or dolimitic limestone  |
| <b>CH</b>   | Chalk                            | <b>FSST</b> | Soft fine grained sandstone          |
| <b>ZR</b>   | Soft argillaceous or silty rocks | <b>GH</b>   | Gravel with non porous (hard) stones |
| <b>MSST</b> | Soft medium grained sandstone    | <b>GS</b>   | Gravel with porous (soft) stones     |

**SI** Soft weathered igneous or metamorphic rock

Stone contents are given in % by volume for sizes >2cm >6cm and total stone >2mm

**STRUCT** The degree of development size and shape of soil peds are described using the following notation

|                                     |                                     |                              |
|-------------------------------------|-------------------------------------|------------------------------|
| <b><u>Degree of development</u></b> | <b>WA</b> Weakly developed Adherent | <b>WK</b> Weakly developed   |
|                                     | <b>MD</b> Moderately developed      | <b>ST</b> Strongly developed |
| <b><u>Ped size</u></b>              | <b>F</b> Fine                       | <b>M</b> Medium              |
|                                     | <b>C</b> Coarse                     | <b>VC</b> Very coarse        |
| <b><u>Ped Shape</u></b>             | <b>S</b> Single grain               | <b>M</b> Massive             |
|                                     | <b>GR</b> Granular                  | <b>AB</b> Angular blocky     |
|                                     | <b>SAB</b> Sub angular blocky       | <b>PR</b> Prismatic          |
|                                     | <b>PL</b> Platy                     |                              |

**CONSIST** Soil consistence is described using the following notation

|                     |                          |                          |                |
|---------------------|--------------------------|--------------------------|----------------|
| <b>L</b> Loose      | <b>VF</b> Very Friable   | <b>FR</b> Friable        | <b>FM</b> Firm |
| <b>VM</b> Very firm | <b>EM</b> Extremely firm | <b>EH</b> Extremely Hard |                |

**SUBS STR** Subsoil structural condition recorded for the purpose of calculating profile droughtiness **G** Good **M** Moderate **P** Poor

**POR** Soil porosity If a soil horizon has poor porosity with less than 0.5% biopores >0.5mm a **Y** will appear in this column

**IMP** If the profile is impenetrable to rooting a **Y** will appear in this column at the appropriate horizon

**SPL** Slowly permeable layer If the soil horizon is slowly permeable a **Y** will appear in this column

**CALC** If the soil horizon is calcareous with naturally occurring calcium carbonate exceeding 1% a **Y** will appear this column

## 2 Additional terms and abbreviations used mainly in soil pit descriptions

### STONE ASSESSMENT

**VIS** Visual **S** Sieve **D** Displacement

## MOTTLE SIZE

|           |                     |          |               |
|-----------|---------------------|----------|---------------|
| <b>EF</b> | Extremely fine <1mm | <b>M</b> | Medium 5-15mm |
| <b>VF</b> | Very fine 1-2mm     | <b>C</b> | Coarse >15mm  |
| <b>F</b>  | Fine 2-5mm          |          |               |

**MOTTLE COLOUR** May be described by Munsell notation or as ochreous (OM) or grey (GM)

**ROOT CHANNELS** In topsoil the presence of rusty root channels should also be noted

**MANGANESE CONCRETIONS** Assessed by volume

|          |              |           |           |        |
|----------|--------------|-----------|-----------|--------|
| <b>N</b> | None         | <b>M</b>  | Many      | 20-40% |
| <b>F</b> | Few <2%      | <b>VM</b> | Very Many | >40%   |
| <b>C</b> | Common 2-20% |           |           |        |

## POROSITY

|          |      |  |
|----------|------|--|
| <b>P</b> | Poor | less than 0.5% biopores at least 0.5mm in diameter |
| <b>G</b> | Good | more than 0.5% biopores at least 0.5mm in diameter |

## ROOT ABUNDANCE

| The number of roots per 100cm <sup>2</sup> |          | Very Fine and Fine | Medium and Coarse |
|--|----------|--------------------|-------------------|
| <b>F</b>                                   | Few      | 1-10               | 1 or 2            |
| <b>C</b>                                   | Common   | 10-25              | 2-5               |
| <b>M</b>                                   | Many     | 25-200             | >5                |
| <b>A</b>                                   | Abundant | >200               |                   |

## ROOT SIZE

|           |           |       |          |        |       |
|-----------|-----------|-------|----------|--------|-------|
| <b>VF</b> | Very fine | <1mm  | <b>M</b> | Medium | 2-5mm |
| <b>F</b>  | Fine      | 1-2mm | <b>C</b> | Coarse | >5mm  |

## HORIZON BOUNDARY DISTINCTNESS

|               |           |                |        |
|---------------|-----------|----------------|--------|
| <b>Sharp</b>  | <0.5cm    | <b>Gradual</b> | 6-13cm |
| <b>Abrupt</b> | 0.5-2.5cm | <b>Diffuse</b> | >13cm  |
| <b>Clear</b>  | 2.5-6cm   |                |        |

**HORIZON BOUNDARY FORM** Smooth wavy irregular or broken \*

\* See Soil Survey Field Handbook (Hodgson 1997) for details
